

Dimensional Design's SafeSpace products: Proven through quantitative and qualitative testing

Quantitative testing: The effectiveness of SafeSpace products can be shown through a number of conventional tests on end users, such as measuring changes in DNA.

Qualitative testing: To test our impact on the field itself, we also utilize qualitative testing methods capable of detecting changes on higher subtle energy planes—changes that traditional scientific instrumentation, with its focus on gross electromagnetic quantity, cannot pick up.

Measuring the biological effect of SafeSpace products with quantitative testing. Independent clinical and laboratory testing using DNA Testing, Heart Rate Variability and Bioresonance Testing have shown the effectiveness of the SafeSpace products on the human body.

Independent clinical and laboratory DNA Testing

For nearly half a century, scientists have known that exposure to heat causes DNA to unwind; as it cools, it recovers and rewinds.

EMFs from cell phones have been shown not only to impair DNA's ability to rewind, but to actually cause DNA to unwind further. DNA deterioration and mutation, of course, has been connected to numerous cancers.

Quantum Biology Labs: testing results on the SafeSpace Cell patch

Quantum Biology Labs, an independent facility with an outstanding national reputation, tested the SafeSpace Cell Phone Patch on actual human DNA. Prolonged use of an unprotected phone, as expected, resulted in DNA deterioration. But when the SafeSpace patch was attached to the phone, this harmful effect was completely neutralized. In fact, DNA rewinding was enhanced.

“Not only was the detrimental effect of electromagnetic (EM) energy completely neutralized when the SafeSpace™ Cell Patch was attached to the cell phone... the DNA rewinding process was enhanced.”

Quantum Biology Research Labs

In other words, the SafeSpace product had a beneficial biological effect on DNA.

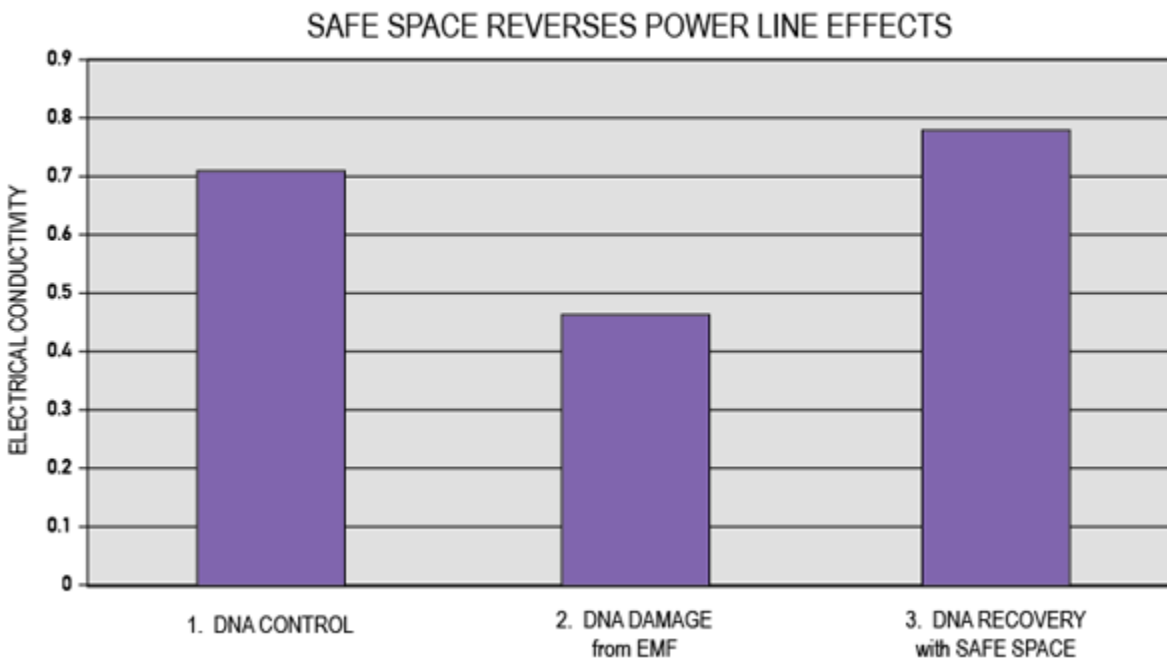

Quantum Biology Labs: testing results on the SafeSpace Energy Strip

Research has also shown that electromagnetic radiation from power strips and power lines in homes and offices inhibits the electrical properties of DNA. The SafeSpace product designed to address that danger is called the SafeSpace Energy Strip.

“The SafeSpace Energy Strip more than completely (110%) reversed the damaging effects from power line radiation. Thus, not only did the Energy Strip bring the biological system back to normal values (control values before exposure to power line radiation), but the conductivity values were enhanced above normal.” Quantum Biology Research Labs

When put through a similar test, the Energy Strip was shown not only to reverse DNA damage, but to improve the DNA.

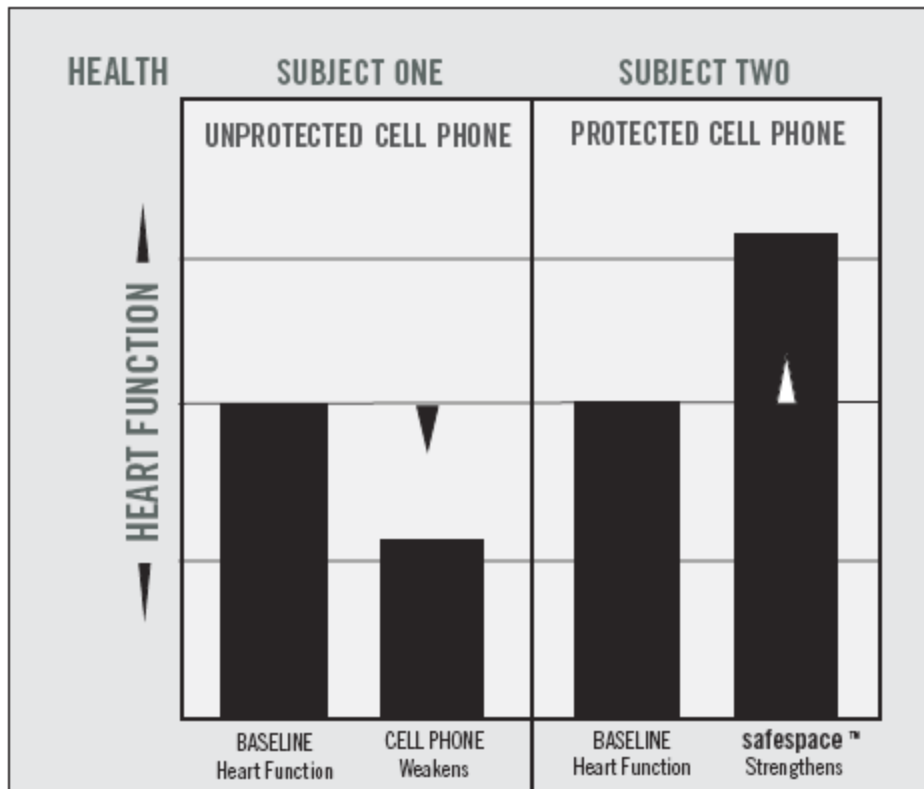

HEART RATE VARIABILITY

Practitioners across the medical and holistic spectrum consider the heart rate variability or HRV test to be one of the best ways to gauge a body's health. The HRV test measures the length of time between each heartbeat, and reflects the neurological, immunological, and hormonal state of the body.

A decrease in HRV is seen as reliable indicator for many common diseases, which is why so many doctors use HRV analysis to help detect disorders in their earliest stages.

Independent laboratory research utilizing HRV testing showed that the EMFs produced by cell phones can decrease heart function. But when the SafeSpace Cell Patch was used, heart function actually increased, demonstrating that the device neutralized EMF disturbance.

Subject 1 demonstrated a **40% decrease** in heart efficiency while using a cell phone
 Subject 2 demonstrated a **56% increase** in heart efficiency while using a cell phone
 with the **safespace™**

* Based on actual testing using a Heart Rate Variability Machine

HRV testing was also used to test the subtle energy effect of the Vitaplex pendant,

“Based on my personal experience from using the Vitaplex and the consistent test results I’ve seen, I feel the Vitaplex Bioresonant Energy Pendant is the most effective, most adaptable and simplest tool one can use for the maintenance of health and well-being.” Dr. Michael Nokken

BIORESONANCE TESTING

Bioresonance testing was used to evaluate stress patterns in the body created by typical cell phone usage. To test the effectiveness of the SafeSpace cell patch, Dr. Michael Nokken used bioresonance testing on test subjects before using a cell phone, while using a cell phone, and then while using a cell phone equipped with the product.

As expected, in most cases, the stress patterns were increased by cell phone usage. But use of the SafeSpace Cell Phone patch was shown to neutralize EMF disturbance created by the cell phones. In fact, the SafeSpace Patch had an overall balancing and strengthening effect on the body, and readings were typically healthier than the original test using no phone whatsoever.

Measuring the energy effects of SafeSpace products with qualitative testing.

To test the impact of our products, we also utilize qualitative testing methods, which are capable of detecting changes

on higher subtle energy planes—changes that traditional scientific instrumentation, with its focus on gross electromagnetic measurements and others, cannot pick up.

Qualitative testing - what is it?

At a certain level, all life is composed of energy; vibrations are constantly being created, sent out and received, and all frequencies have their own relationship and harmonic. In qualitative testing, the interaction of these subtle fields can be measured.

Qualitative measurement allows us to analyze and understand the subtle energetic impacts of SafeSpace products on the environment and people. Tools designed to function as extensions of the human energy system are used for detection and measurement of specific qualities. Based on the principle of selective resonance, the tools help the researcher to focus on whatever aspect is being tested. This process helps the researcher to observe a multidimensional effect.

A detailed assessment of a wide range of energetic phenomena is employed in our qualitative testing process. Using a range of measurement scales we are able to scientifically analyze how the SafeSpace products interact with environments, objects and biological organisms. Methodologies used include:

Heart Rate Variability (HRV)

The health of the entire body can be determined by analyzing the length of time between each heartbeat. The difference in time between each heartbeat is referred to as heart rate variability (HRV). Like a fingerprint, each individual's heart rate variability is unique. This "fingerprint" reflects all of the fluctuating neurological, immunological, and hormonal processes that occur in a human body. A decrease in heart rate variability has emerged as the single most common risk factor for many chronic

diseases, such as diabetes, chronic fatigue, chronic heart failure, neurological disorders, and many other conditions.

HRV testing has shown the effectiveness of SafeSpace products in supporting the body's ability to stay balanced against a variety of stress fields.

Autonomic Response Testing (ART)

ART is the only system of manual muscle testing to be advocated by some of the world's leading brain researchers and neurologists. Leading neurologists have coined ART as the only true biofeedback tool because no external devices are used on the body. ART can easily detect the beginnings of imbalance by observing changes in autonomic nervous system (ANS) activity as shown by manual muscle testing. Autonomic Response Testing uses recent advancements in heart and brain research to interpret the day-to-day functional health of the human body.

ART testing of the SafeSpace products has shown their effectiveness in neutralizing the EMF toxins

Kinesiology

Kinesiology, which is the study of the body movement and muscle response, effectively indicates where blocks and imbalances are impairing physical, emotional or energetic wellbeing. There are many factors in the environment which can interfere with the flow of vital force through our electrical bodies, consequently causing weakness on a muscle test. The testing of the relative energy available to muscles -- which is also associated with the energy flow through the body (meridians) -- allows the kinesiologist to assess a subject's energy level and determine ways to promote healthy flow. Kinesiological testing has shown that stress, emotional blockages and toxins can detrimentally affect the glands and organs, as well as other systems.

Kinesiological testing of the SafeSpace products has repeatedly shown that the energy flow to the muscles

strengthened dramatically. Testing has also dramatically demonstrated these products balancing and strengthening effect on the glands and other systems of the body-mind.
